

# Mindreading & Joint Action

## **9. Interacting Mindreaders**

[butterfills@ceu.hu](mailto:butterfills@ceu.hu)

# conjecture

The prior existence of capacities for shared agency partially explains how sophisticated forms of mindreading emerge in evolution or development (or both)

1. All shared agency involves shared intention.

2. Shared intention requires sophisticated mindreading.

Therefore:

3. The prior existence of capacities for shared agency ~~partially explains~~ cannot explain how sophisticated forms of mindreading emerge in evolution or development (or both)

1. All shared agency involves shared intention.

2. Shared intention requires sophisticated mindreading.

Therefore:

3. The prior existence of capacities for shared agency ~~partially explains~~ cannot explain how sophisticated forms of mindreading emerge in evolution or development (or both)

G is a distributive goal: it is an outcome to which each agent's actions are individually directed and it is possible that: all actions succeed relative to this outcome.

---

shared motor action

---

G is a collective goal

- (a) it is a distributive goal;
- (b) the actions are coordinated; and
- (c) coordination of this type would normally facilitate occurrences of outcomes of this type.

1. we each have a motor representation of G;
2. we are each disposed to inhibit some (not all) of the resulting planning or actions;
3. we each expect that if G occurs, we will all be agents of its occurrence; and
4. (1) and (2) because (3)

understanding  
distributive goals

The prior existence of capacities for shared agency partially explains how sophisticated forms of mindreading emerge in evolution or development (or both)

pure goal  
ascription

step 1: pure goal ascription to minimal theory of mind

# conjecture

The prior existence of capacities for shared agency partially explains how sophisticated forms of mindreading emerge in evolution or development (or both)

pure goal ascription

- (1) reliably:  $R(a,G)$  when and only when  $a$  is directed to  $G$
- (2)  $R(a,G)$  is readily detectable
- (3)  $R(a,G)$  is readily detectable without any knowledge of mental states

$R(a,G) =_{df}$   $a$  is the most justifiable/efficient action towards  $G$  available within the constraints of reality and  $G$  is desirable

$R_M(a,G) =_{df}$  if planning mechanism  $M$  were tasked with producing outcome  $G$  it would plan action  $a$ , and  $G$  is desirable.

**Your-goal-is-my-goal**

## **Your-goal-is-my-goal**

1. You are willing to engage in some joint action or other with me
2. I am not about to change the single goal to which my actions will be directed.

Therefore:

3. A goal of your actions will be the goal I now envisage my actions being directed to.

## Your-goal-is-my-goal

1. You are willing to engage in some **joint action**\* or other with me

2. I am not about to change the single goal to which my actions will be directed.

Therefore:

3. A goal of your actions will be the goal I now envisage my actions being directed to.

## Your-goal-is-my-goal

1. You are willing to engage in some **joint action\*** or other with me

2. I am not about to change the single goal to which my actions will be directed.

Therefore:

3. A goal of your actions will be the goal I now envisage my actions being directed to.

## Your-goal-is-my-goal

1. You are willing to engage in some **joint action\*** or other with me

2. I am not about to change the single goal to which my actions will be directed.

Therefore:

3. A goal of your actions will be the goal I now envisage my actions being directed to.

[\*in at least the minimal sense associated with distributive goals]

## Your-goal-is-my-goal

1. You are willing to engage in some joint action\* or other with me
2. I am not about to change the single goal to which my actions will be directed.

Therefore:

3. A goal of your actions will be the goal I now envisage my actions being directed to.
